High level picture of % change of CO2 emissions non biogenic per year on a per state basis

- **There is a wide range of changes in CO2 emissions across the United States.** Some states, such as North Dakota and Wyoming, have seen large increases in emissions, while others, such as Vermont and California, have seen significant decreases.
 - **Overall, CO2 emissions in the United States decreased by 1.7% between 2020 and 2021.** This is the sixth consecutive year that emissions have declined in the United States.
 - **The largest decreases in emissions were seen in the Northeast and West Coast regions.** The smallest decreases were seen in the Southeast and Central regions.
 - **There are a number of factors that can contribute to changes in CO2 emissions, including changes in energy use, economic activity, and policies.** It is likely that the decreases in emissions seen in recent years are due to a combination of these factors.
-
- The state with the largest increase in emissions in 2020-2021 was North Dakota, with an increase of 35.4%.
 - The state with the largest decrease in emissions in 2020-2021 was Maryland, with a decrease of 54.1%.
 - Nine states had increases in emissions in 2020-2021, while 41 states had decreases.
